Example 5, Fig 16, 104pp; English.

This sequence is deduced from the cDNA clone 489-Vk15 and includes the amino acid sequence beyond the first scop codon. The clone is incomplete, starting from the G of the Arg initiator colon, but the initial Met is given. Antibody molecules of the invention can include one or two aberrant light chains containing a duplicated antibodies were found to produce hadner antibodies. These heavier antibodies were found to have higher antibodies. These heavier fust a single copy of the L'V region. The antibodies can be used to treat disease, e.g. infection by Streptococcus agalactiae. They are see also Q11879 and Q11880.
                                                                                                                                                                                                                                                                                                                                                                                                                       Oligomeric immunoglobulin(s) with high avidity for antiqen(s) formed by duplicating esp. variable region of light chain of lqG
                                          01-AUG-1991 (first entry)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This sequence is derived from the nucleotide sequence encoding the light chain variable region. The "x" residues represent nonsense codons. The coding sequence has been translated in all 3 reading frames (see also R12130 and R12131). The L'V region is duplicated in so-called "aberrant" light chains (see Q11878), conferring increased avidity on antibodies comprising such aberrant chains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Oligomeric immunoglobulin(s) with high avidity for antigen(s) - formed by duplicating esp. variable region of light chain of IgG

```
This sequence is deduced from the cDNA clone 4B9-Vk15 and includes the amino acid sequence beyond the first stop codon ("x" in the sequence repersents a nonsense codon). The clone is incomplete, starting from the G of the ATG initiator codon, but the initial Met is given. Antibody molecules of the invention can include one or two aberrant light chains containing a duplicated variable region, to produce heavier antibodies. These heavier antibodies were found to have higher avidity than antibodies with just a single copy of the L'V region. The antibodies can be used to treat disease, e.g. infection by Streptococcus agalactiae. They are able to pass across

                                                              This sequence is deduced from the CDNA clone 4M9-Vkl% and includes the amino acid sequence beyond the first stop codon ("x" in the sequence represents a nonsense codon). The clone is incomplete, starting from the G of the ATG initiator codon, but the initial Met is given. Antibody molecules of the invention can include one or two aberrant light chains containing a duplicated variable region, to produce heavier antibodies. These heavier antibodies were found to have higher avidity than antibodies with just a single copy of the L'V region. The antibodies can be used to treat disease, e.g. infection by Streptococcus agalactiae. They are able to pass across
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            24 ltgspatlslspgeratlscrasgsvssylawygdypgaprlllydasnratgiparfs 83

The V-kappa specific oligonucleotide 050327 was used to probe a human placental queuolic DNA library offound into lambdaEMBL3/sp6/77 bund fraqments containing V-kappa segments from positive phage clones were subcloned into plasmid vectors. Variable gene segments from the resulting clones were sequenced and functional clones were sequenced on the basis of open reading frames, intact donor and acceptor splice sites and intact recombination sequences. The sequences obtained from four different plasmid clones were sequences obtained from four different plasmid clones were sequences obtained from four different plasmid clones were sequences obtained the amino acid sequences of the V-kappa regions

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            14-APR-1997 (first entry)
DNA fragment vk65.3, variable kappa chain protein product.
Variable: kappa chain; gene segment; human; DNA fragment; vk65.3; unrearranged; light chain; minilocus; transgene; transgenic; mouse;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        heterologous antibody production. The deduced amino acid
aggeneroes of the V-Kappa coding regions are given in E62429 E62931.

DNA fragments containing V-kappa segments from positive phage clones were subcloned into plasmid vectors. Variable gene segments from the resulting clones were sequenced and functional clones were selected on the basis of open reading frames, intact donor and acceptor splice sites and intact recombination sequences. The agenences obtained from four different plasmid clones were designated p65.3, p65.8 and p65.15 (see Q4422-Q4422).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1; Indels 0; Gaps
                                                                                                                                                                                                                                                                                                                                                                       Saps
                                                                                       Example 21: Fig 41: 94pp; English.

The present sequence is the protein product of the variable kappa chain gene segment containing human DNA fragment, vk65.3, which was co-injected along with the human DNA fragments vk65 5, vk65 8 and vk65.15 into half day mouse embryo pronuclei, to generate an unrearranged light chain minilocus transgene. The resulting transgenic mice can be used for the production of heterologous (i.e. human) antibodies against specific antigens, this comprises immunishing a mouse with a preselected antigen and collecting antigen binding heterologous human gamma immunoglobulins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Transgenic non-human animals contg. immunoglobulin heavy chain trans gene - used to produce useful antibodies by isotype

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               DNA fragment vk65.5, variāble kappa chain protein product. Variāble; kappa chāin; gene segment; human; DNA fragment; vk65.5; unrearranged; light chain; minilocus; transgene; transgenic; mouse; production; heterologous; antibody; gamma; immunoglobulin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Disclosure, Fig. 42, 296Fg. English Muman DNA fragments vk65 3, vk65.8 and vk65.15 (given in Q78822-QN885), respectively) each contain a V-kappa gene segment that can be used to form a complete human light chain minilocus transgene for expression in a nonhuman transgene animal for heterologous antibody production. The deduced amino acid sequences of the V-kappa coding regions are given in P62:28*-P62931.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Fransgenic non-human animals producing heterologous or chimeric
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              - for binding a pre-determined human antigen with

Page 215-216: 248pp; English.

Lymphocyte mRNA was converted to cDNA and subjected to PCR amplification using primers specific for heavy and light chain amplification products were inserted into a dicistronic vector to produce a library of fragments. E. coli XLI Blue cells were transformed with the library Filamentous phage were produced which expressed the MAb regions on their surface. Panning with gp120 and gp41 resulted in the recovery of immunoractive clones. The light chain VL region sequence R54275 neutralises HIVI
                                                                                                                                                                                                                                                          24 ltqspatlslspgeratlscrasqgvssylawyqqkpqqaprlliydasnratgiparfs 83

Anti-HIV gp41 immunoglobulin light chain V region clone DL 41 19.
Human immunodeficiency virus: HIVI; glycoprotein gp41; epitope:
neutralisation; monoclonal antibody; light chain; variable region;
framework region; complementarity determining region.
                                              Example 21: Fig 42; 94pp; English.

The present sequence is the protein product of the variable kappa chain gene segment containing human DNA fragment, vk65.5, which was co-injected along with the human DNA fragments vk65.3, vk65.8 and vk65.15 into half day mouse embryo pronuclei, to generate an unrearranged light chain minilocus transgene. The resulting transgenic mice can be used for the production of heterologous (i.e. human) antibodies against specific antigens, this comprises immunising a mouse with a preselected antigen and collecting antigen binding heterologous human gamma jamunoglobulins.
                        Prodn. of heterologous human immunoglobulin(s) - by immunising transgenic mice

Monoclonal antibody binding to VI/V2 loop of HIV gpl20 - used in passive immuno: therapy and detection of HIV infection.

Example 3: Fig 19: 366pp. English.

The sequences given in W01320-24 represent the light chain variable regions (VH) of a series of antibody fragments (FAb's) which are immunoreactive with HIV glycoprotein gp41. This sequence represents the sequence of the clone, DL 4119. These sequences represent light chains which bind to the heavy light chain clones given in W01315-19. A monoclonal antibody containing one of these Fab sequences may have the capacity to reduce HIV infectivity titre in an in vivo virus infectivity assay by 50 % at a concentration of less than 700 ng of antibody/ml.

The MAD may be used for determining immunocompetence of a human anti-HIV sequence. 109 AA:
                                                                       Ä

VL of Fab, DL 41 19, binds to HIV gp41.
Heavy chain, light chain; variable region; VH; monoclonal antibody;
HAB; HIV, human immunodeficency virus, glycoprotein, gp120; clore;
virus infectivity assay; precursor gp16; immunocompetence; human;
anti-HIV antibody; detection; HIV infection.

Blood samples were collected from patients immunised with allergens including ragweed (Ambrosia elator) extracts. The dominant allergen in short ragweed (Ambrosia elator) extracts. The dominant allergen in short ragweed is Amb al. Purified PBLs were immortalised and the resultant clones were screened using Amb a l protein. A single cell sublone AL 16-5.2, secreting Amb al-specific 1964, kappa antibody was selected. Total c RNA was prepd. from the AL 16-5.2 cells and first strand cDNA was pred. using oligo dT primers. When the first strand cDNA was used as the template, and the 5' and 3' kappa light chain primers (06654) c 066541) were used in PCR and amplified band of the expected size was noted. The DNA sequence of several subclones confg. this amplified C sequence are shown in 066538 and R56286. Comparison of the deduced
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 4 ltqspqtlslspgeratlscrasqtvssnylawyqhkpgqaprlliyatsirssgipdrf 63

Monoclonal antibody binding to VI/V2 loop of HIV gpl20 - used in passive immuno:therapy and detection of HIV infection.

PT Ranoclonal antibody binding to VI/V2 loop of HIV gpl20 - used in passive immuno:therapy and detection of HIV infection.

PT Ranoclonal antibody and detection of HIV infection.

The sequences given in W01320-24 represent the light chain variable communoreactive with HIV giveoprotein gp41. This sequence represents the sequence of the clone, GL 41. These sequences represent light chains which bind to the heavy light chain clones given in W01315-19. A monoclonal antibody containing one of these Fab sequences may have the capacity to reduce HIV infectivity titre in an in vivo virus infectivity assay by 50 % at a concentration of less than 700 ng of antibody/ml.

The MAD may be used for determining immunocompetence of a human anti-HIV antibody and in the detection of HIV infection.

PT *Or in vitro diagnosis and for passive immuno-therapy
PS Claim 11: Page 217: 248pp: Enalish.
CC Lymphocyte mRNA was converted to cDNA and subjected to PCR
CC amplification using primers specific for heavy and light chain
CC variable regions. The amplification products were inserted into a
CC dicistronic vector to produce a library of fragments. E.coli XLI
CC Rlue cells were transformed with the library. Flamentous phage were
CC produced which expressed the MAb regions on their surface. Panning
CC vith gpl20 and gp41 resulted in the recovery of immunoreactive
CC vith gpl20 and gp41 resulted in the recovery of immunoreactive
CC op41.
SQ Sequence 111 AA:
CC GP41.

An immuncqiobulin hererotetramer subunit consists of two identical light (kappa or lambda) and two identical heavy (alpha delta, epsilon, agmma, or mu) chains usually stabilized by interchain disulfide bonds. In some cases, such as IgA and IgM, the subunits associate into larger

This sequence represents the sequence of the JKI gene clone, b24. A MAb containing this VL sequence has the capacity to reduce HIV infectivity titre in an in vivo virus infectivity assay binds mature gpi20 preferentially over the precursor gpi60. The MAD may be used for determining immunocompetence of a human anti-HIV mad antibody and in the detection of HIV infection

Disclosure, Page 74-75, 109pp; English.
The nucleotide sequence of F105 Vk (Q42707 - sequence differs from other F105 Vk sequences given elsewhere in the specification) was compared with germline gene Humwk325 (Q42706), showing 97.7% similarity. By nucleotide sequence analysis, F105 appears to be derived from a member of the Vk III subgroup gene family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         DNA segments encoding monoclonal antibody - which binds to \ensuremath{\mathsf{gpl}}\xspace20 and neutralises HIV, for treating AIDS, and for diagnosing and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Lymphocyte mRNA was converted to CDNA and subjected to DCR amplification using primers specific for heavy and light chain variable regions. The amplification products were inserted into a dicistronic vector to produce a library of fragments. E.coli XLI Blue cells were transformed with the library. Filamentous phage were produced which expressed the MAD regions on their surface. Panning with 9p120 and 9p41 resulted in the recovery of immunoreactive clones. The light chain VK region sequence R54311 is from a gp120-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         1 eltqspqtlslspqeratlscrasqslsnnylawyqqkpgqaprlliygsstrgtgipdr 60

VL region of HIV neutralising MAD, clone B20.
Heavy chain: light chain; variable region; VH· monoclonal antibody.
MAD; HIV; human immunodeficiency virus; qlycoprotein; gpi20; clone; virus infectivity assay; precursor gp160; immunocompetence; human; anti-HIV antibody; detection; HIV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New human monoclonal antibodies neutralising HIV - react with appl20 or gp41 and nucleic acid encoding them, useful for in vivo or in vitro diagnosis and for passive immuno-therapy Example; Page 180; 248pp; English.
                10-NOV-1994 (first entry)
Anti-HIV gpl20 immunoglobulin light chain variable region B20.
Human immunodeficiency virus: HIV1: glycoprotein gpl20: epitope: neutralisation; monoclonal antibody; kappa light chain; varlable region; framework; complementatity determining region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               61 fsgggsgtdftlisrlepedfavyycqhyqnsvytfgqgtkleik 106

regions (VL) of a series of monoclonal antibodies (MAP's) which are immunoreactive with HIV glycoprotein gpl20 and are capable of neutralising HIV. This sequence represents the sequence of the JK2 gene clone, B20. A MAB containing this VL sequence has the capacity to reduce HIV infectivity titre in an in vivo virus infectivity assay by 50.8 at a concentration of less than 700 ng of antibody/ml, and hinds mature gpl20 preferentially over the precursor gpl60. The MAB antibody and in the detection of HIV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      l eltgspgtlslspgeratlscrasgslsnnylawyggkpggaprlliygsstrgtgipdr 60

                                                                                                    The sequences given in W0126192 represent the light chain variable regions (VL) of a series of monoclonal antibodies (MAb's) which are immunoreactive with HIV glycoprotein gp120 and are capable of neutralising HIV. This sequence represents the sequence of the JK2 gene clone, b6. A MAD containing this VI, sequence has the capacity to reduce HIV infectivity titre in an in vivo virus infectivity assay by 50 % at a concentration of less than 700 ng of antibody/ml, and binds mature gp120 preferentially over the precursor gp160. The MAD may be used for determining immunocompetence of a human anti-HIV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Imphocyte mRNA was converted to cDNA and subjected to PCR amplification using primers specific for heavy and light chain variable regions. The amplification products were inserted into a dicistronic vector to produce a library of fragments. E.coli XLI Blue cells were transformed with the library. Filamentous phage were produced which expressed the MAb regions on their surface. Panning with gpl20 and gp41 resulted in the recovery of immunoreactive
                                                                                                                                                                                                                                                                                                                                                                                                            1 eltgspgtlslspgeratlscraggsissnylawyggkpggaprlliygasnratgipdr 60

Anti-HIV gpl20 immunoglobulin light chain variable region b6.
Human immunodeficiency virus; HIV1; glycoprotein gpl20; epitope;
neutralisation; monoclonal antibody; kappa light chain;
variable region; framework; complementarity determining region.
                                                                                                                                                                                                                                                                                                                                 89.8%; Score 684; DB 19; Length 108; 88.7%; Pred. Blood samples were collected from patients immunised with allergens including ragweed (Ambrosia elator) extracts. The dominant allergen in short ragweed (Ambrosia elator) extracts. The dominant allergen in short ragweed (Ambrosia elator) extracts. The dominant allergen in short ragweed (Ambrosia elator) extracts. The dominant allergen then fused with mouse mylome acli line 653 and the resultant clones were screened using Amb a l protein. A single cell sublone AL 16-5.2. Secreting Amb alloaded in 165-5.2 cells and first strand cDNA was used so pred. Using oligo dT primers. When the first strand cDNA was used as the template, and the 5.2 and 3' kappa light chain primers (066540). O66541) were used in PCR and amplified band of the expected size was noted. The DNA sequence of several subclones cong. this amplified sequence and its deduced AA sequence are shown in 066538 and R56286. Comparison of the deduced that it is a member of the human VK III subgp.

Human neutralising monoclonal antibodies to respiratory syncytial virus - for treatment prophylaxis and diagnosis of PSV and other diseases of the respiratory tract diseases of the respiratory tract.

The sequences given in R50215-19 represent the heavy and light chain variable domains of various clones of a human monoclonal antibody which binds to an epitope on qlycoprotein F of respiratory syncitial wirds (RSV) These antibodies may be used as a reagent for the diagnosis of RSV disease and other viral mucosal diseases, eq.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          influenza virus, rhinovirus and coronavirus. They are particularly useful in ameliorating RSV when delivered directly to the lungs, and may also be used for treating pneumonia and bronchiolitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    2 aeltqspgtlslspgeratlscratqsissnylawyqqrpqqaprlliygasnratdipd 61

immunoreactive with HIV givoprotein gp41. This sequence represents the sequence of the clone, DL 41 19. These sequences represent light chains which bind to the heavy light chain clones given in W01315-19. A monoclonal antibody containing one of these Fab sequences may have the capacity to reduce HIV infectivity titre in an in vivo virus infectivity assay by 50 % at a concentration of less than 700 ng of antibody/mil. The MAD may be used for determining immunocompetence of a human anti-HIV antibody and in the detection of HIV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           2 aeltgspgtlslspgervivscrasgsvssnylawyggkpggaprlliygasnratgipd 61

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Antibodies prepr. used for treatment of auto-immune diseases - by replacement of critical residues to reduce immunogenicity but retain binding affinity, etc.

Claim 2: Page 93-94: l60pp; English.

The consensus amino acid sequences for the subgroups of light chains (hKI - R38590, hK3 - NGK, hK2 - GST, hL1 - R38591, hL2 - R38592, hL3 - R38593, hL3 - R38593, hL4 - R38593, hL4 - R38599, and hL5 - R38690) of human variable domains may be used to prepare, for example, a modified mouse antibody variable domain that retains the affinity of the natural domain for antigen while exhibiting reduced
                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                           clones. The light chain VL region sequence R54275 neutralises HIV1
               gp120 or gp41 and nucleic acid encoding them, useful for in vivo or in vitro diagnosis and for passive immuno-therapy claim 11; Page 215-216; 248pp; English.

Lymphocyte mRNA was converted to cDNA and subjected to PCR amplification using primers specific for heavy and light chain variable regions. The amplification products were inserted into a dicistronic vector to produce a library of fragments. E.coli XLI
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This ensures that the binding properties of the modified antibody
                                                                                                                                                                                                                                                                                                                                                        4; Indels 1;

regions (VL) of a series of monoclonal antibodies (MAb's) which are immunoreactive with HIV glycoprotein pp120 and are capable of meutralising HIV. This sequence represents the sequence of the JK2 gene clone, s6. A MAb containing this VL sequence has the capacity to reduce HIV infectivity titrs in an in vivo virus infectivity assay by 50 % at a concentration of less than 700 ng of antibody/Ml, and binds mature gp120 preferentially over the precursor gp160. The MAb

Example: Page 186-187: 248pp: Epglish.

Example: Page 186-187: As converted to CDNA and subjected to PCF amplification primers specific for heavy and light chain avariable regions. The amplification products were inserted into a dicistronic vector to produce a library of fragments. E. coli XLI Rlue cells were transformed with the library. Filamentous phage were produced which expressed the MAD regions on their surface. Panning with qp120 and gp41 resulted in the recovery of immunoreactive clones. The light chain VK region sequence R54317 neutralises HIVI

Monoclonal antibody binding to VI/V2 loop of HIV gpl20 - used in passive immuno:therapy and detection of HIV infection.

PT Rample 3; Fig 19; 36Pp: Baplish.

The sequences given in W01220-24 represent the light chain variable regions (VH) of a series of antibody fragments (FAb's) which are Immunoreactive with HIV giveoprotein gp41. This sequence represent light chains which bind to the heavy light chain clones given in W01315-19. A monoclonal antibody containing one of these Fab sequences may have the capacity to reduce HIV infectivity titre in an in vivo virus infectivity assay by 50 % at a concentration of less than 700 ng of antibody/m1 antibody and in the detection of HIV infection.

Sequence III AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     2 aeltgspgtlslspgeratlscrasgsvsngylawyggkpggaprlliygastratdipd 61

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Mean 41.449; Variance 70 285; scale 0 590
